DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1, 4-6, 8, 12-15, and 17-22 are rejected under 35 U.S.C. 102(b) as being anticipated by US Patent 3921764 to Mathauser.

Re: claims 1, 12-15, 17, and 18. Mathauser shows in figures 4 and 5 a self-energizing brake assembly comprising a support 49,51,52 pivotally mounted at an angle relative to a rotatable brake member RW and a friction member 31' pivotally mounted relative to the support via element 56 and movable along the support between engaged figure 5 and disengaged figure 4 positions with the rotatable brake member to generate a braking force between the friction member and the rotatable brake member wherein the angle of the support is variable for controlling a self-energizing gain in the braking force.

Re: claims 4 and 6. Mathauser shows in figure 5 the assembly comprising an adjustable member 38' biasing the support toward the rotatable brake member.

Re: claim 5. Mathauser shows the assembly comprising a compliant member 40 as best shown in figure 2.

Re: claim 8. Mathauser shows in figures 4 and 5 a drive actuator 38' to apply a force to the friction member by decreasing the angle between the rotatable brake member and the support.

Re: claims 19-22. Mathauser shows in figures 4 and 5 a self-energizing brake assembly comprising a support 48,49,52 pivotally mounted at an angle relative to a rotatable brake member RW, a brake pad friction element 30',31' pivotally attached to a base 50 movable along the support, particularly portion 52 of the support between an engaged position and a disengaged position with the rotatable member to generate a brake force against movement of the rotatable member wherein the braking force comprises an applied force and a gain component generated in excess of the applied force, and an actuator or the manual means used to adjust 27' within 28 for varying the angle of the support for controlling the gain component of the braking force.

Allowable Subject Matter

3. Claims 2 and 3 are allowed.

Response to Arguments

4. Applicant's arguments with respect to rejected claims have been considered but are moot in view of the new ground(s) of rejection.
